

3.1

Text normalization – convert all to same case

Remove noise – remove special characters

Tokenization – Splitting words to individual

Stemming and Lemmatization – Running to run

Removing html tags and abbreviations

Setting the content to UTF-8

3.2 (3)

Reinforcement learning means learning between the learner and the environment on the basis of reward and penalties

There are two processes known as exploration – where u learn from the data and the other is known as exploitation where the learnt data is implemented . It is rewarded for each correct taks and charged as penalties for each incorrect answerFor example if we teach dog to fetch a ball then next time it does fetch the ball , if it bites some human then it is hit so that it comes to know not to bite people next time
